

Coconut Oil

How to soothe dry, flaky skin and lock moisture back in.

How to Apply

Warm a small amount between your hands until it melts, then rub a thin layer onto the dry, flaky areas. Let it soak in for about five minutes. If your dog still feels greasy after, you can rinse lightly. Use a small amount, a thin layer absorbs, a thick layer just sits on top and gets licked off.

How Much to Use

Your Dog's Weight	Amount Per Application	How Often
Up to 20 lbs	Pea sized amount	Once daily on dry spots
20 to 50 lbs	Dime to nickel sized	Once daily on dry spots
50 lbs and up	Quarter sized amount	Once daily on dry spots

Best Spots to Treat

- Dry, flaky elbows and hocks
- Cracked nose or rough paw pads
- Dry belly skin (not red or infected)
- Coarse, dull patches of coat

IMPORTANT, DO NOT USE ON YEASTY OR INFECTED SKIN: Skin dermatologists warn that coconut oil can actually FUEL yeast and bacterial infections because it traps heat and moisture. If the skin is red, smelly, greasy, oozing, or has a musty odor, that is likely yeast. Skip the coconut oil and see your vet.

BUY THIS: Use unrefined, virgin coconut oil. Start with a tiny amount the first few times to make sure your dog's skin tolerates it, and stop if licking or redness increases.
