

Fish Oil (Omega-3)

The exact EPA and DHA dose for YOUR dog's size.

Dose by Weight (Skin and Allergy Support)

This is the key: dose by the COMBINED milligrams of EPA and DHA, not the total size of the capsule. Read the supplement facts panel and add EPA plus DHA together. The amounts below target skin and allergy support. Always start low and build up over 1 to 2 weeks.

Your Dog's Weight	Daily EPA + DHA Target	Start Low At
10 lbs	About 250 to 400 mg	100 mg
25 lbs	About 600 to 900 mg	250 mg
50 lbs	About 1,000 to 1,500 mg	400 mg
75 lbs	About 1,500 to 2,000 mg	600 mg
90 lbs and up	About 1,800 to 2,400 mg	700 mg

What to Look For on the Label

- Lists EPA and DHA amounts separately (so you can add them)
- Anchovy or sardine sourced (cleaner, lower mercury)
- Third-party tested for purity and heavy metals
- Comes in a dark bottle or sealed capsules (fish oil goes rancid in light)

START LOW, GO SLOW: Begin at about a quarter of the target dose and build up over 1 to 2 weeks. Too much too fast causes loose stools or vomiting. Skin results take 8 to 12 weeks of daily use, so be patient.

ASK YOUR VET FIRST IF: your dog is on blood thinners, has a history of pancreatitis, or is overweight. Fish oil adds fat and calories and can interact with some conditions.
